

**Abstract of the Disclosure**

A method and system for automatically loading foam pellets which clean fluid carrying passages, such as hydraulic tubing, into a pneumatic launcher. The pellets are automatically transferred from a storage sleeve into the pneumatic launcher for subsequent propulsion through the tubing. Interior walls of the passages are scrubbed clean as the pellets pass therethrough. In addition, the method and system can easily convert a conventional foam cleaning pellet pneumatic launcher from a manual loading operation to a fully automatic loading operation, thereby increasing overall productivity of the cleaning operation.
